

# *Sphagnum* in the Southern Pennines

Angus Rosenburgh  
Manchester Metropolitan University

# Drivers of degradation

- **Industrial pollution**
- **Drainage**
- **Grazing/ trampling**
- **Wildfire**

# Improving conditions

# Restoration

- Lime
- Fertiliser
- Heather brash
- Grass nurse crop
- Plug plants
  
- Geo-textiles
- Gully blocking

# The big questions

1. Are the biogeochemical characteristics of degraded Pennine peatlands limiting the performance of *Sphagnum*?
2. Can we re-introduce *Sphagnum* as part of the restoration works?

# Effect of biogeochemistry

- Comparison with intact sites
- Vegetation recorded, vegetation, peat and porewater samples
  - Peat pH, moisture content, total C & N
  - Porewater metals, nutrients & pH
  - Extractable metals & nutrients
  - Total metals
  - Vegetation total metals, total C & N

# Sampling

- 10 samples per intact site
- 20 samples per degraded Pennine site – 10 with *Sphagnum*, 10 adjacent without
- Inter- and intra-site comparison

# Pb

# NO<sub>3</sub>

# Next steps

- Regression analysis to establish causes
- Relationship with vegetation chemistry
- Link with depositional data

# Summary

- Conditions are improving; less pollution and restoration works
- *Sphagnum* will survive and persist
- Likely to be pollution legacy limiting success
