

# Water management and the environment in India – can outside experience help?

Mike Acreman

# Managing water allocation

# Local livelihoods

Fish for fisheries

Grass for cattle

Fertile soils and  
natural irrigation

# Biodiversity

- Nature conservation
- Biodiversity (e.g. river dolphins)

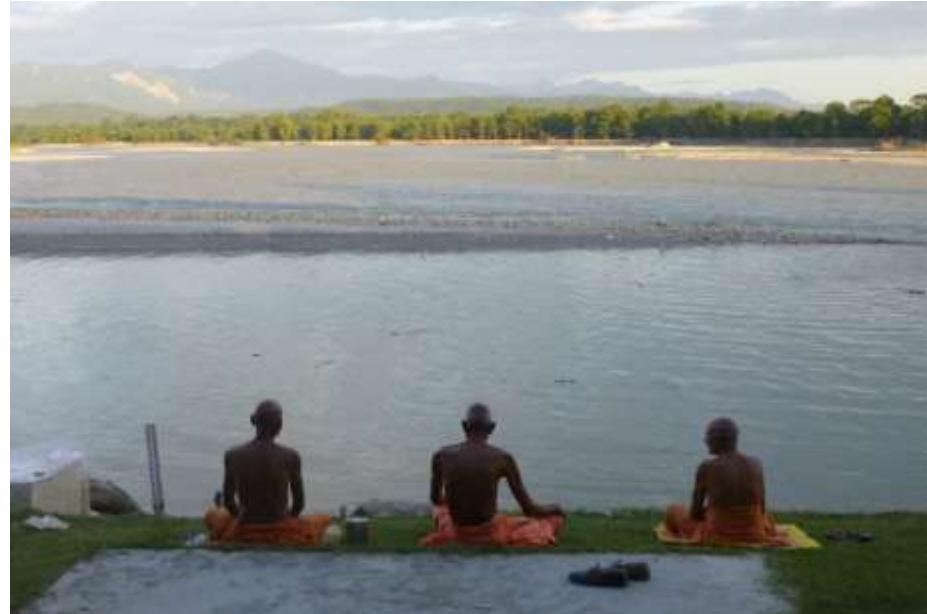

# Cultural services

Family/community history

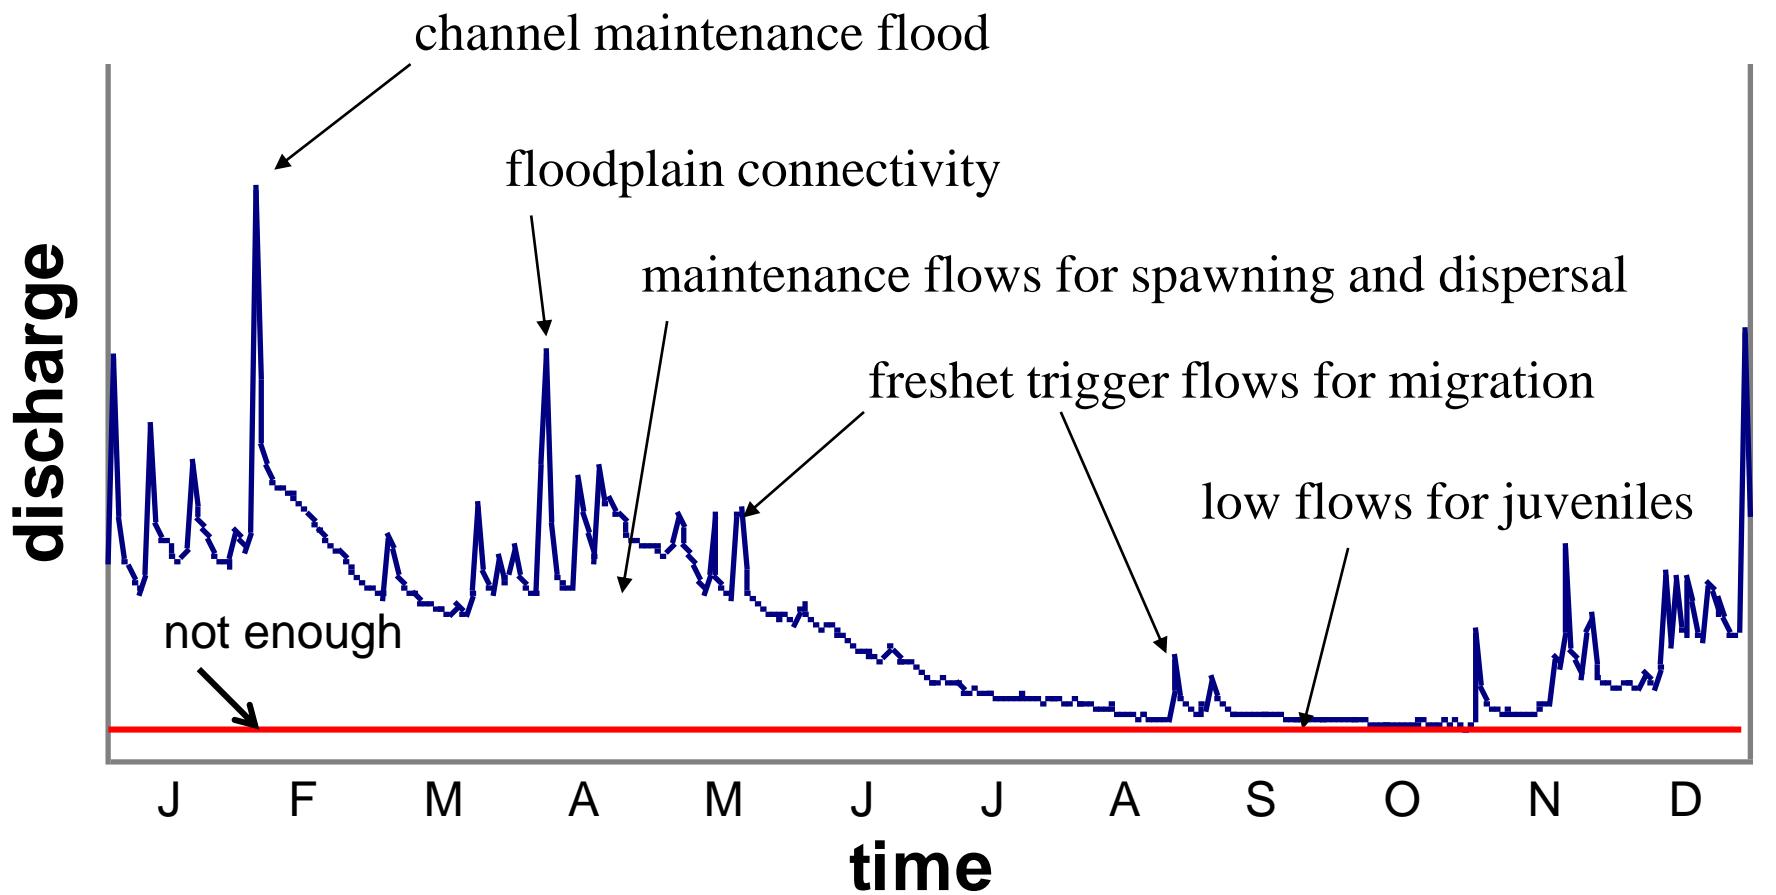

Spiritual/religious connection

Tourism

Quality of life

# Why is the whole flow regime important?

All aspects of the flow regime are important for some element of the river ecosystem

# Environmental flows

*.. the quantity, timing and quality of water flows required to sustain freshwater and estuarine ecosystems and the human livelihoods and well-being that depend on these ecosystems.*

Brisbane Declaration 2007

# SUSTAINABLE DEVELOPMENT GOALS

## 6. Sustainable water management

- **6.3** improve water quality ... reducing pollution  
... chemicals ... untreated wastewater
- **6.4** ensure sustainable withdrawals ...
- **6.6** protect and restore ... ecosystems ...  
forests, wetlands, rivers, aquifers, lakes

# How much water does a river need?

- No single answer
- Over 250 methods
- Big questions

What sort of river do you want?

What are the pressures on the river?

What will the future bring?

# Objective-based flows

- **Conservation objective**
  - maintain nature character  
e.g. Ramsar site
- **Ecosystem service objective**
  - Maintain depth for river festival

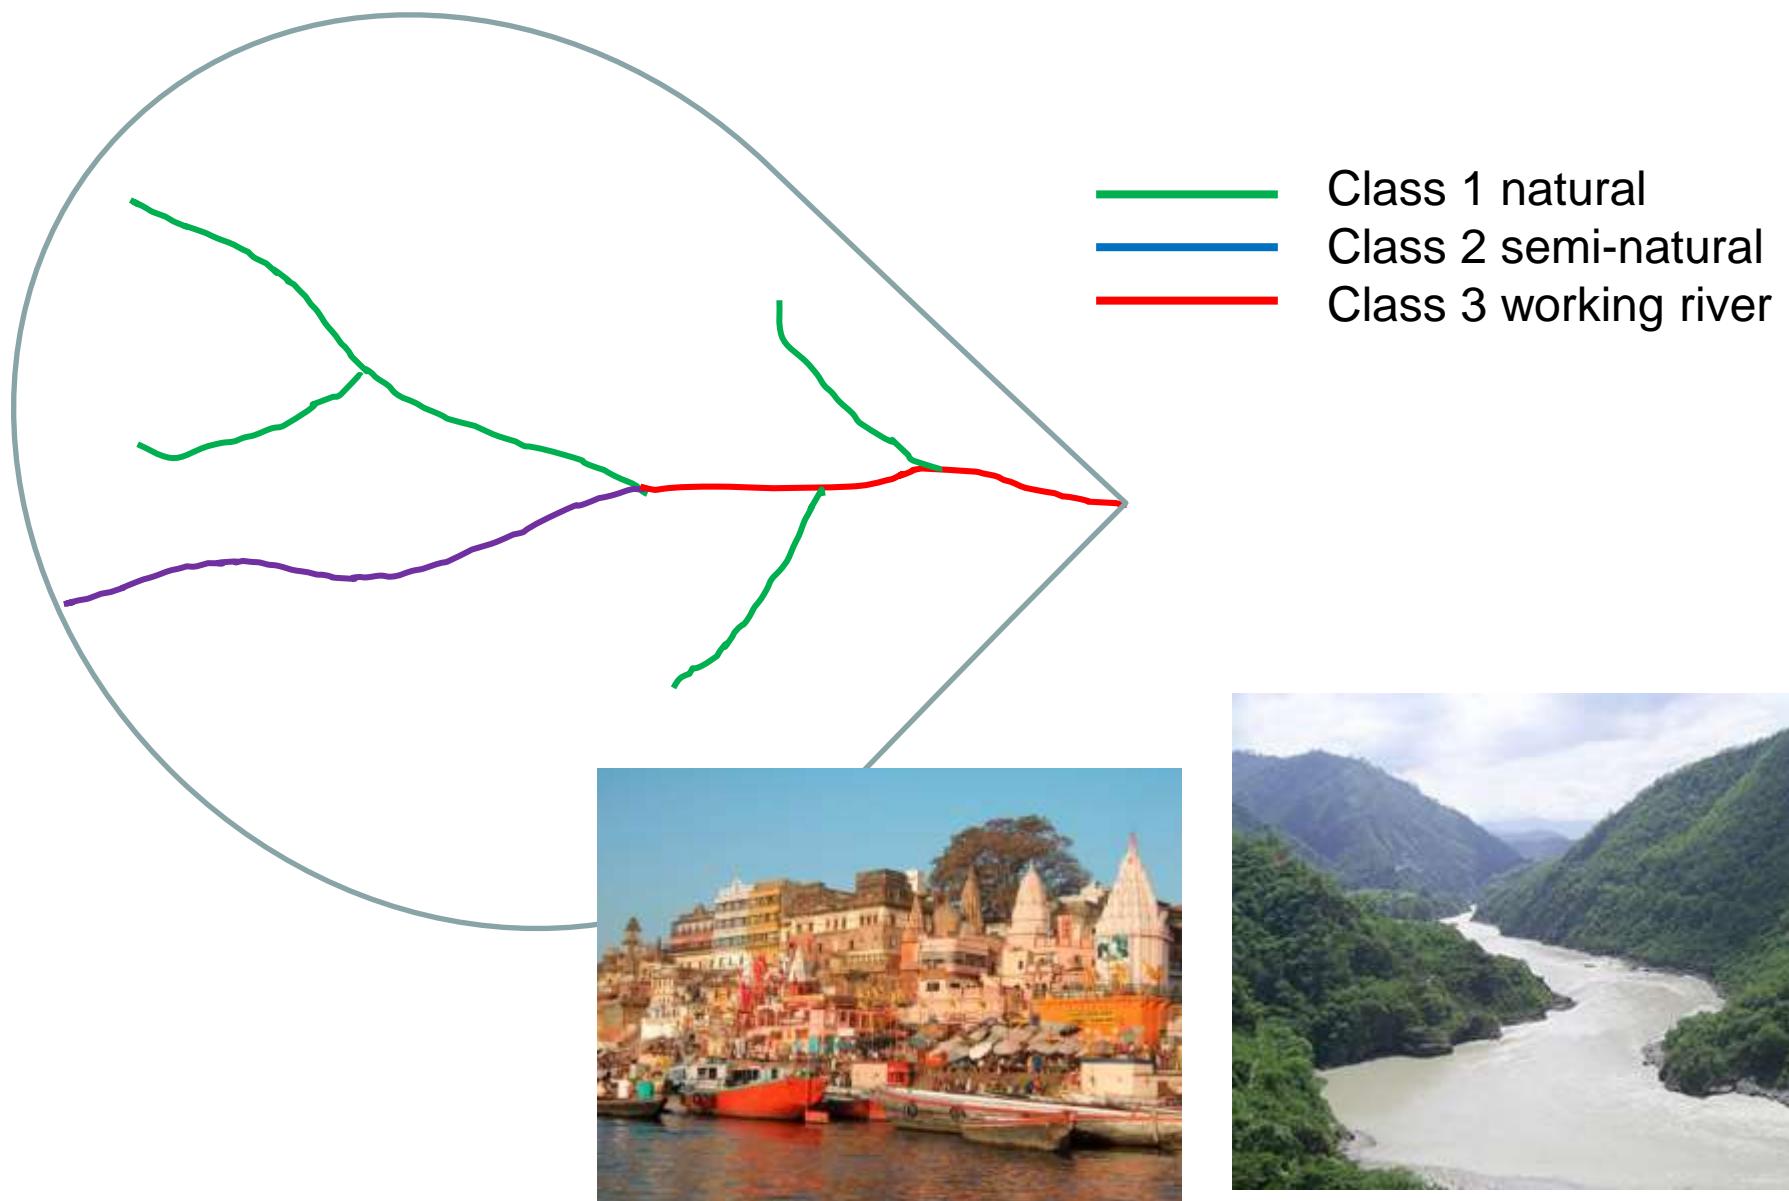

# Scenario-based flow setting

- No pre-set objective
- Stakeholder participation
  - awareness raising
  - local community action
- Trade-off between water uses
  - economic value
  - political decision

# River management classes

# Lateral connectivity

Flood pulse  
concept

Linking the river to  
its floodplain  
wetlands

Exchange of  
species, carbon,  
nutrients

Human well-being

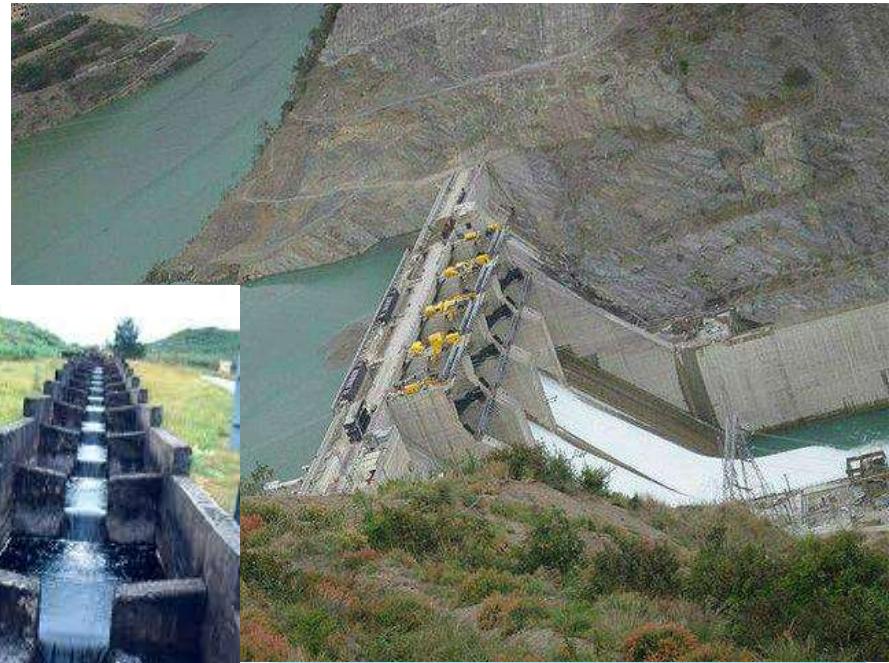

# Longitudinal connectivity

River continuum  
concept

Dams disrupt  
continuum

Need to release  
water and sediment  
downstream

Allow fish and other  
species to move  
upstream

# What can be learnt from elsewhere?

Thames basin

10,000 km<sup>2</sup>

650 mm rainfall

15 million people

significant water stress

recycled 7 times

# The River Thames 1858

- The Great Stink
- Smell of Thames - untreated human waste and effluent
- Parliament suspended
- Prompted sewerage

# The River Thames 2008

- Fishing, boating, swimming ....
  - Spiritual re-connection
  - Eco services restored e.g. water purification
- 
- 2010 Winner of International Theiss River Prize

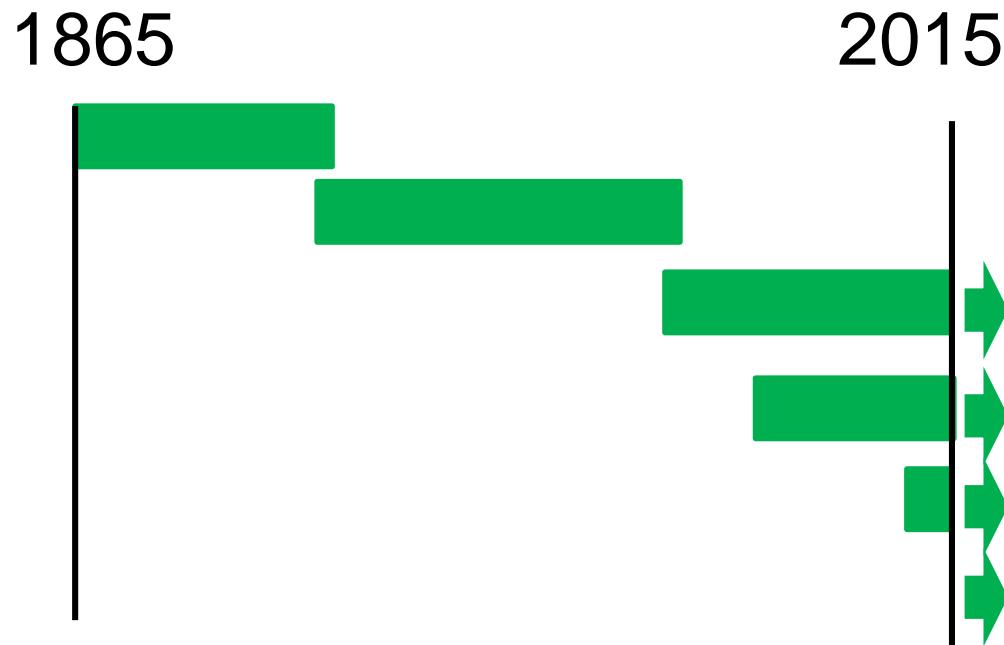

# 150 years of work

Clear long term vision  
A journey with people

## Key steps

sewerage installed  
industrial pollution control  
environmental flows  
nutrients (P stripping)  
nano-particles, oestrogen  
water trading

# What sort of river do you want?

natural  
10,000 BC

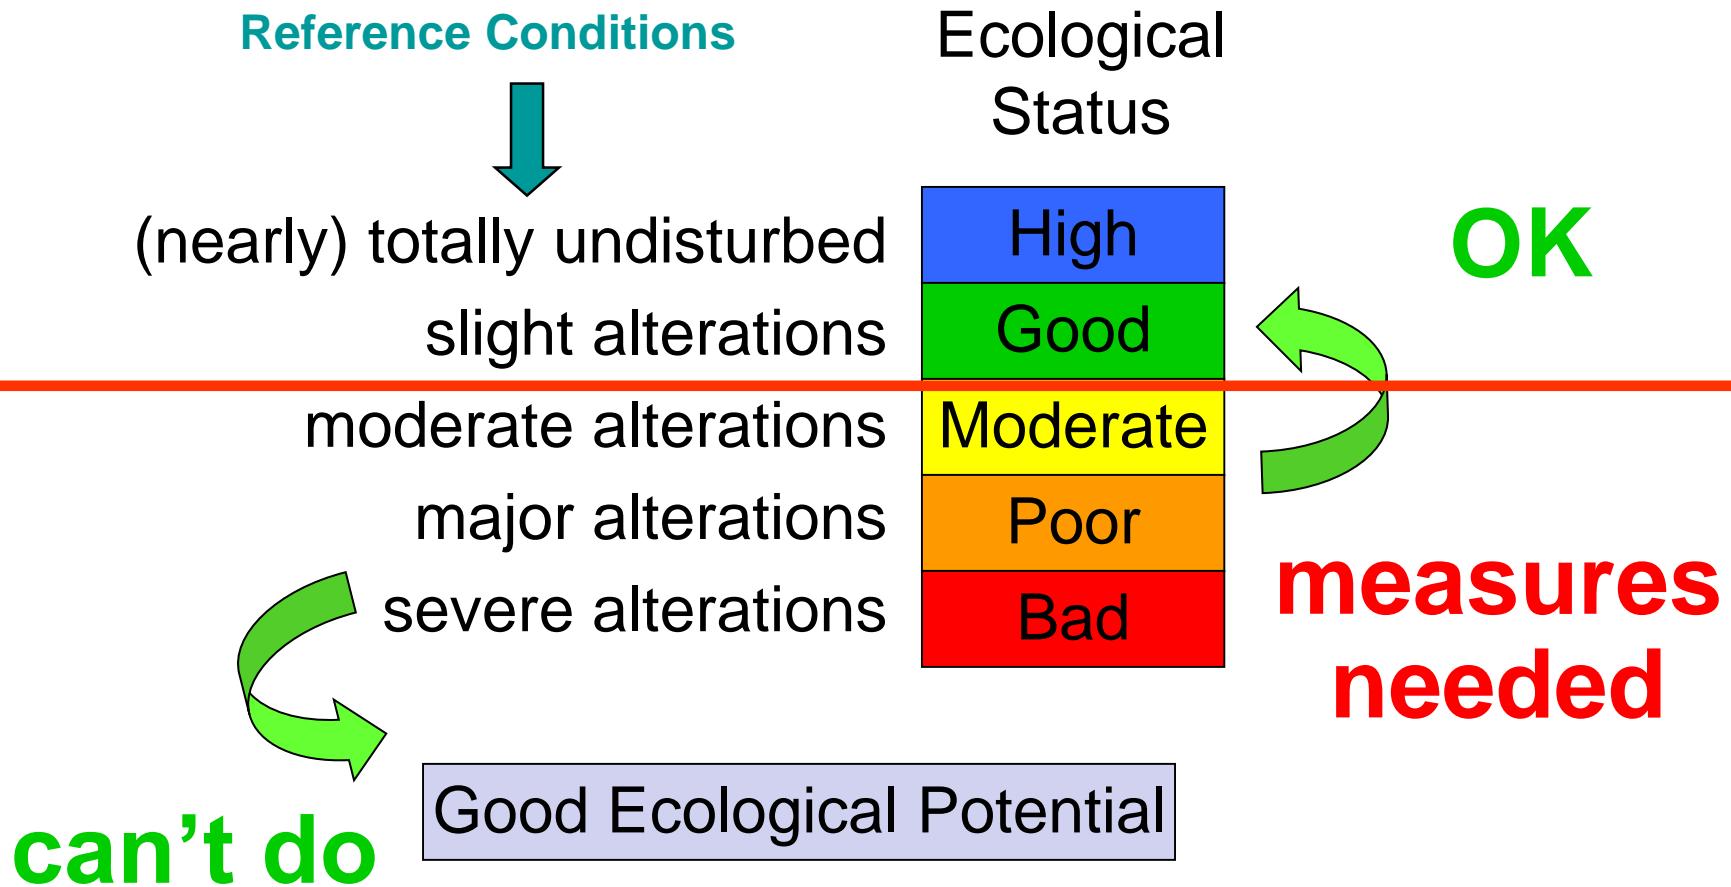

golden age  
1821

recent past (when I was young)

# European Water Framework Directive

# Realistic objectives

- 2000 years of management
- Important heritage
- Protected for managed habitats
- Natural conditions not desirable

# Solutions in Thames

Clear vision through participation

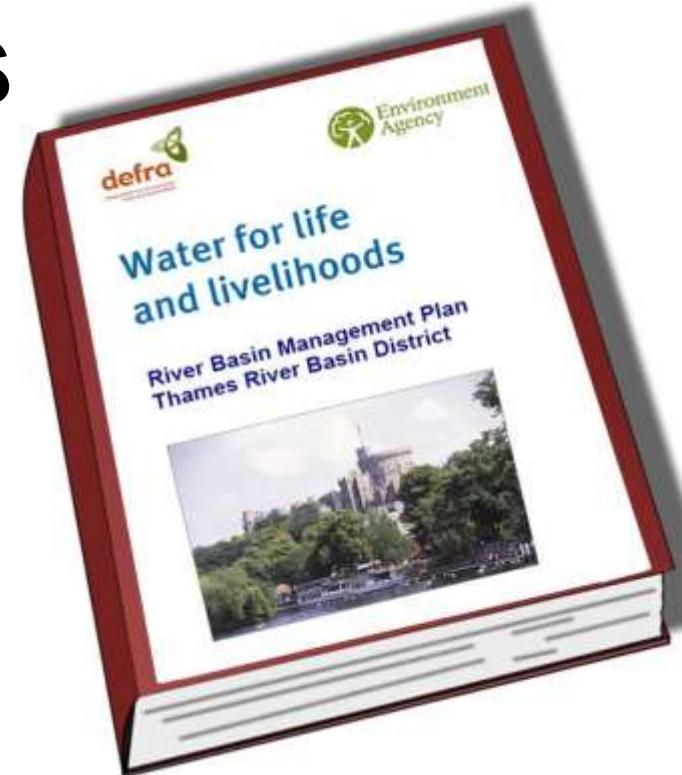

Water provision for London

Ensuring water is returned to the river; good quality

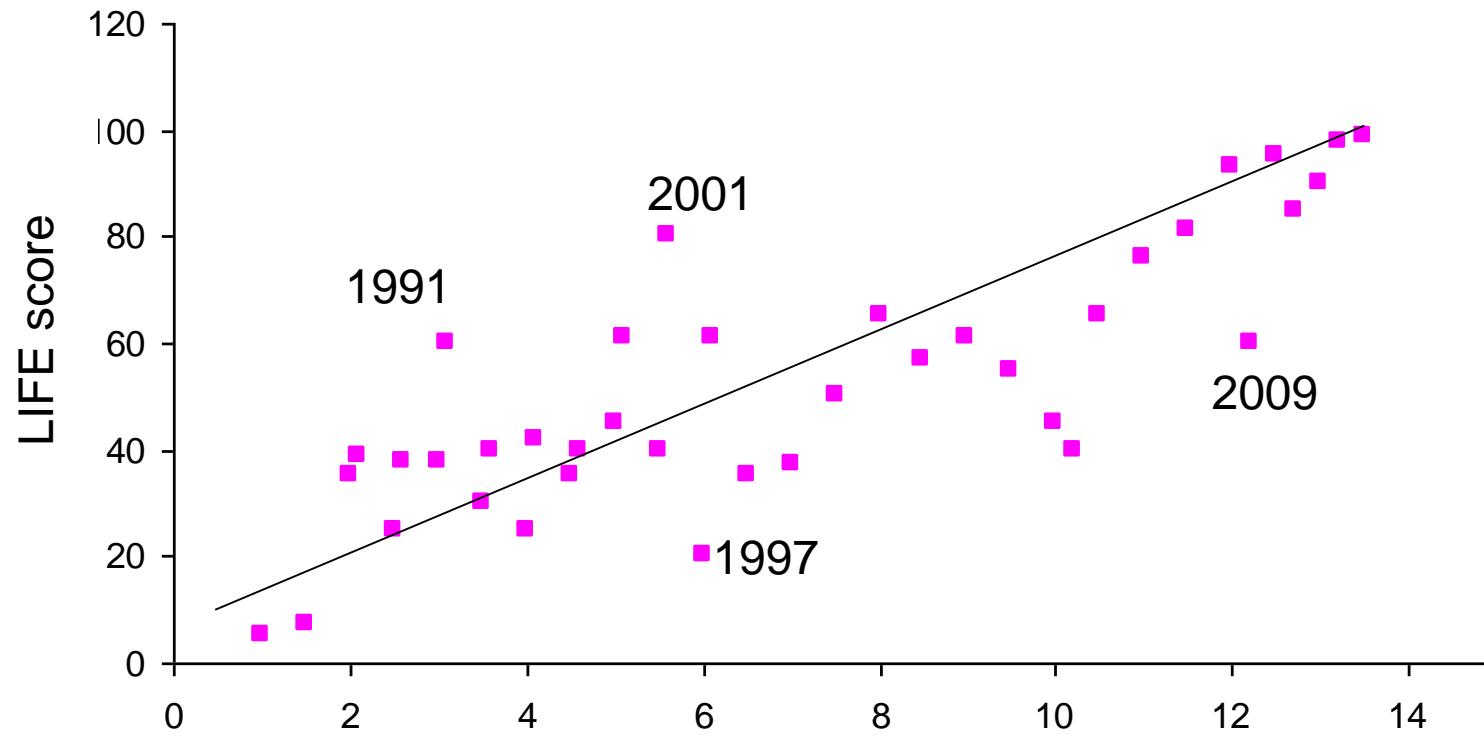

Restoring floodplains for multiple benefits

Connectivity through barriers (fish passes)

Good data to assess options

# No substitute for good data

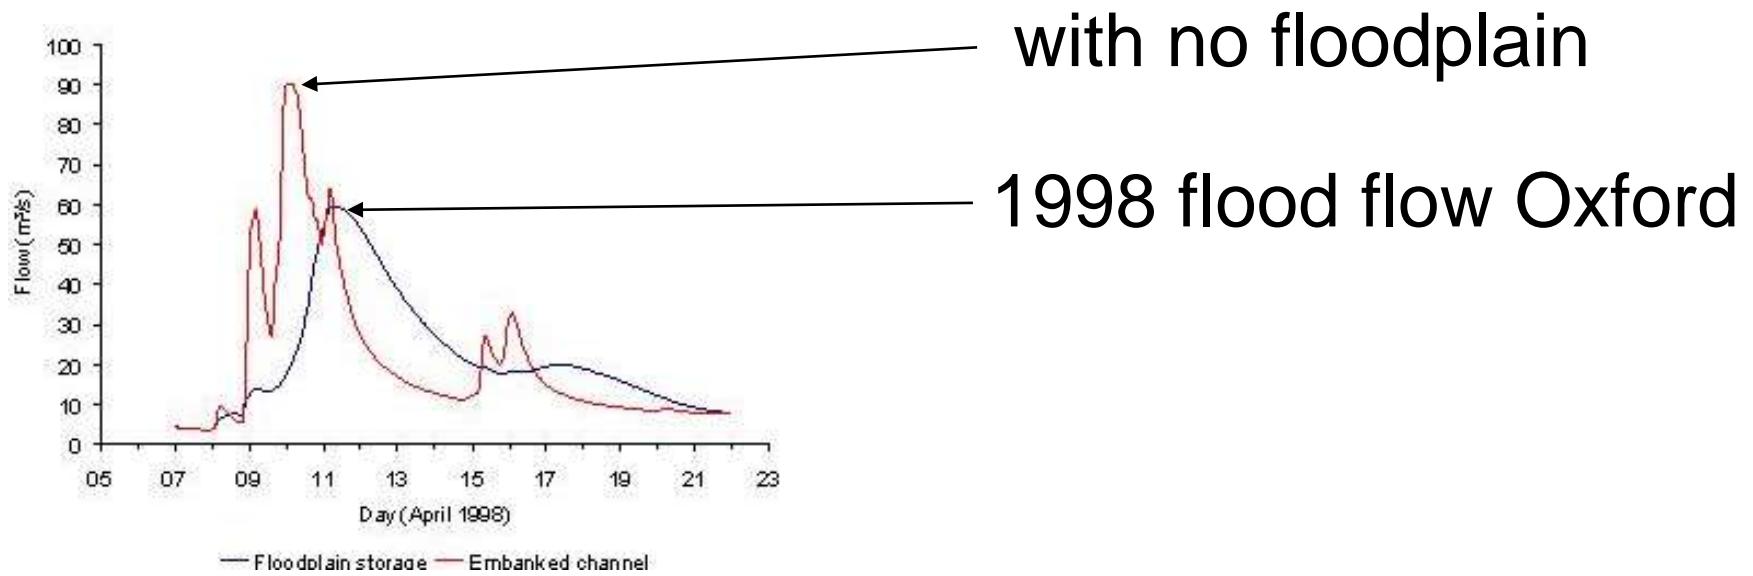

No threshold

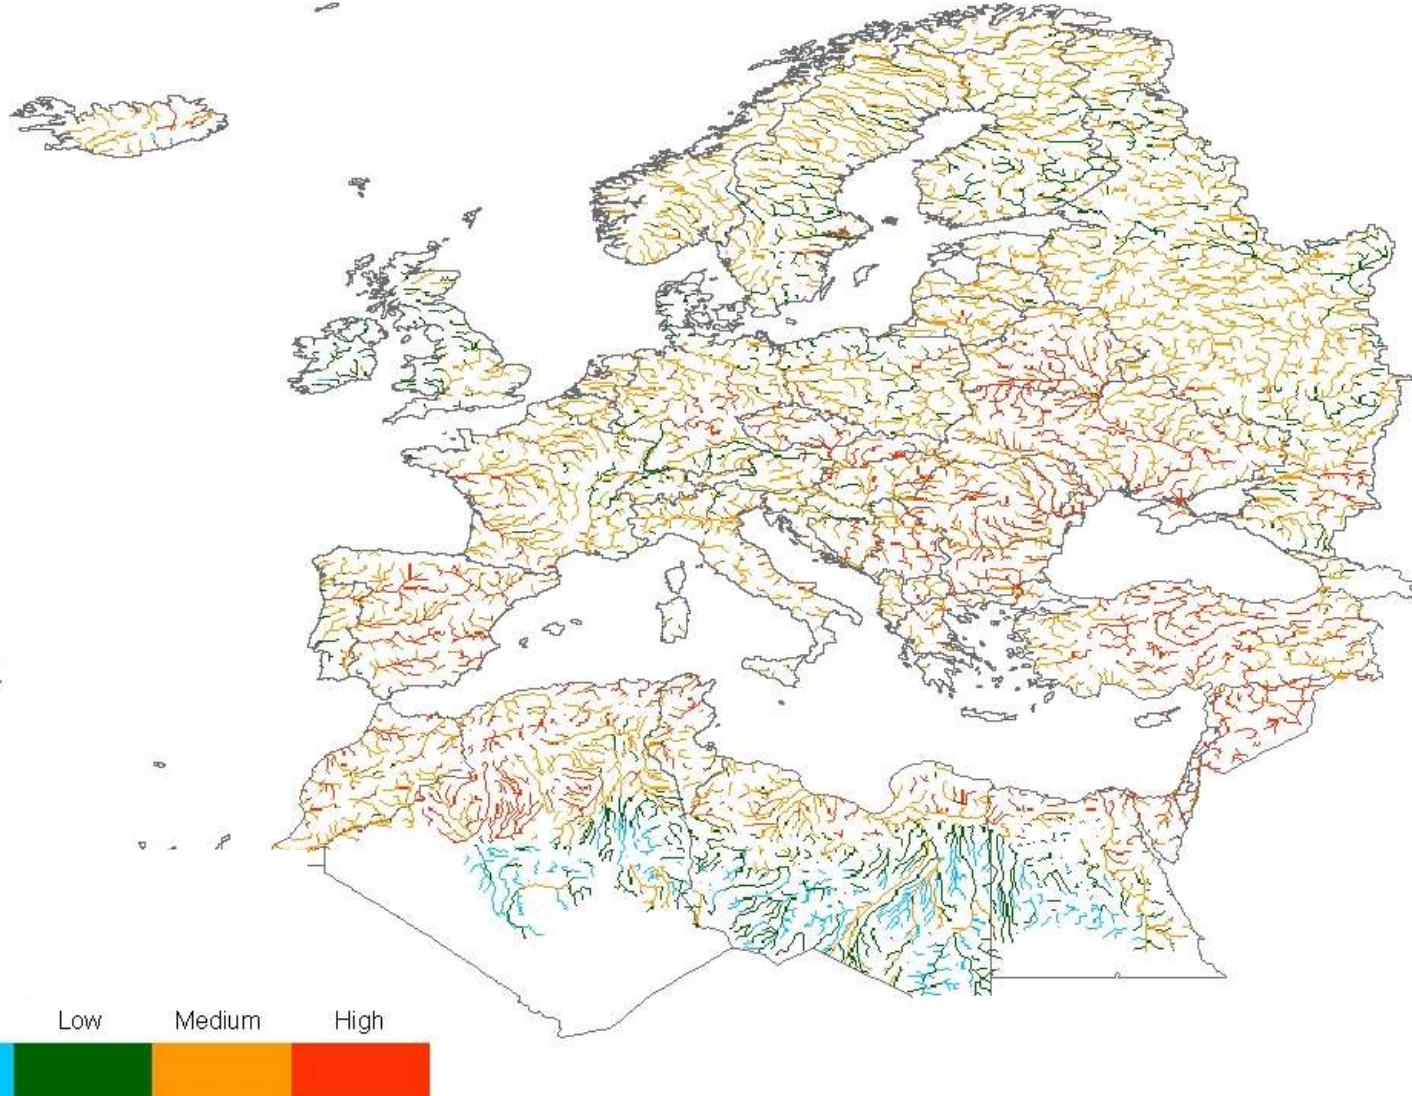

Flow index

# Studies of ecosystem services

## Floodplain wetlands control floods

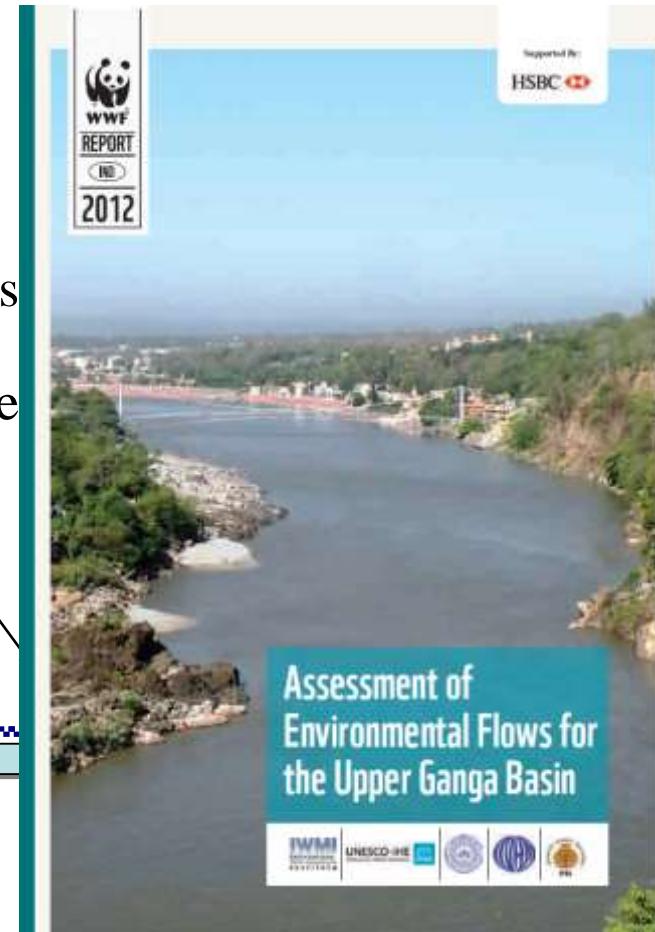

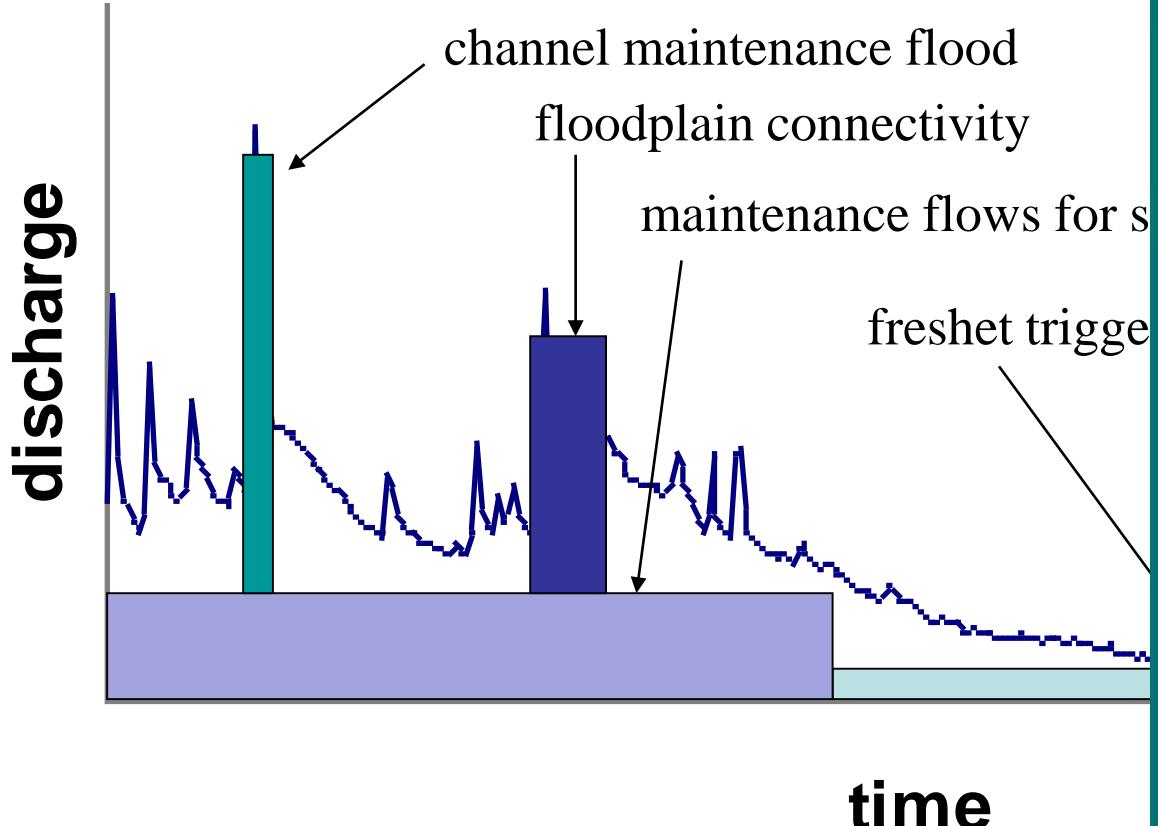

# Assessment of future risk ecological impact from hydrological alteration

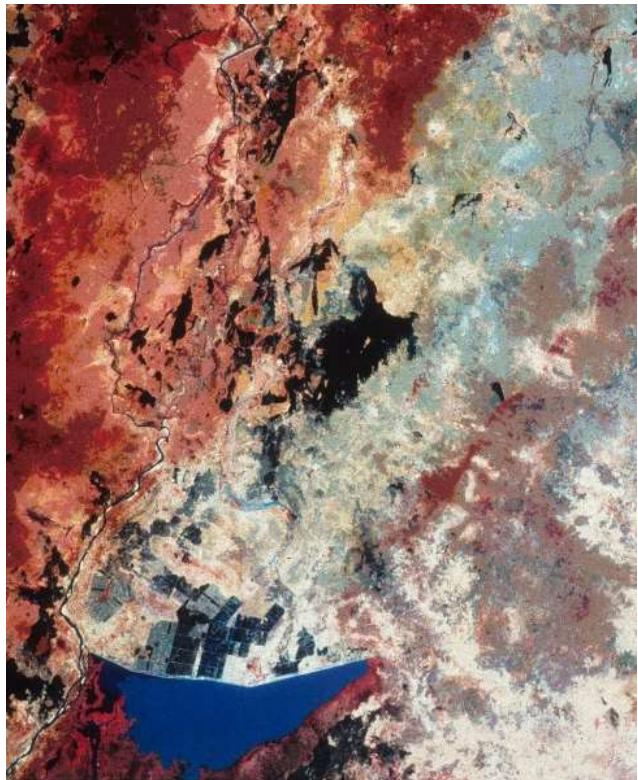

# E-flow methods

## releases from dams

Quantity – magnitude, timing, duration, frequency  
Quality – temperature, sediment

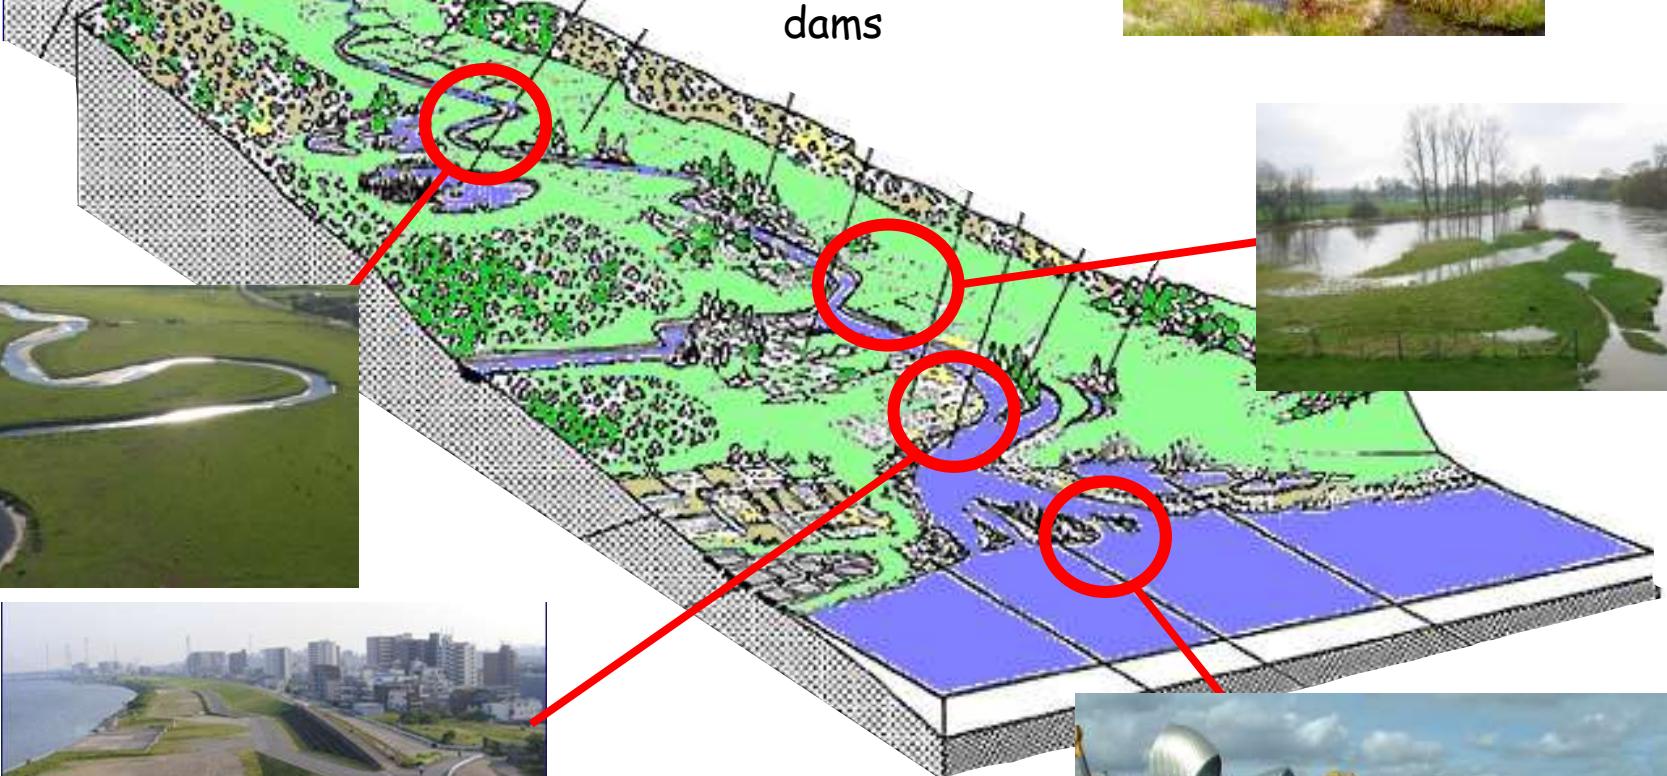

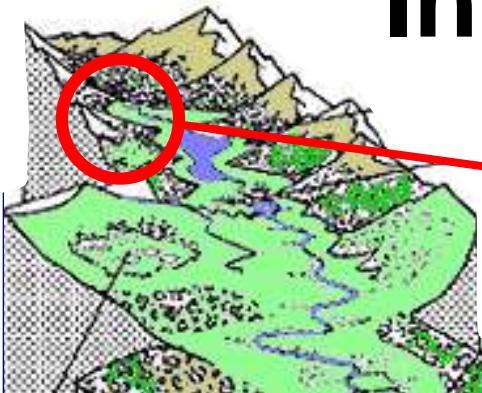

# Logone floodplain, Cameroon

- Maga dam led to reduced floodplain inundation
- Loss of eco services to local community
- Environmental flow releases made
- Value of fisheries, grazing, water resource
  - € 1.4-2.7 million per annum
- Better than natural conditions?

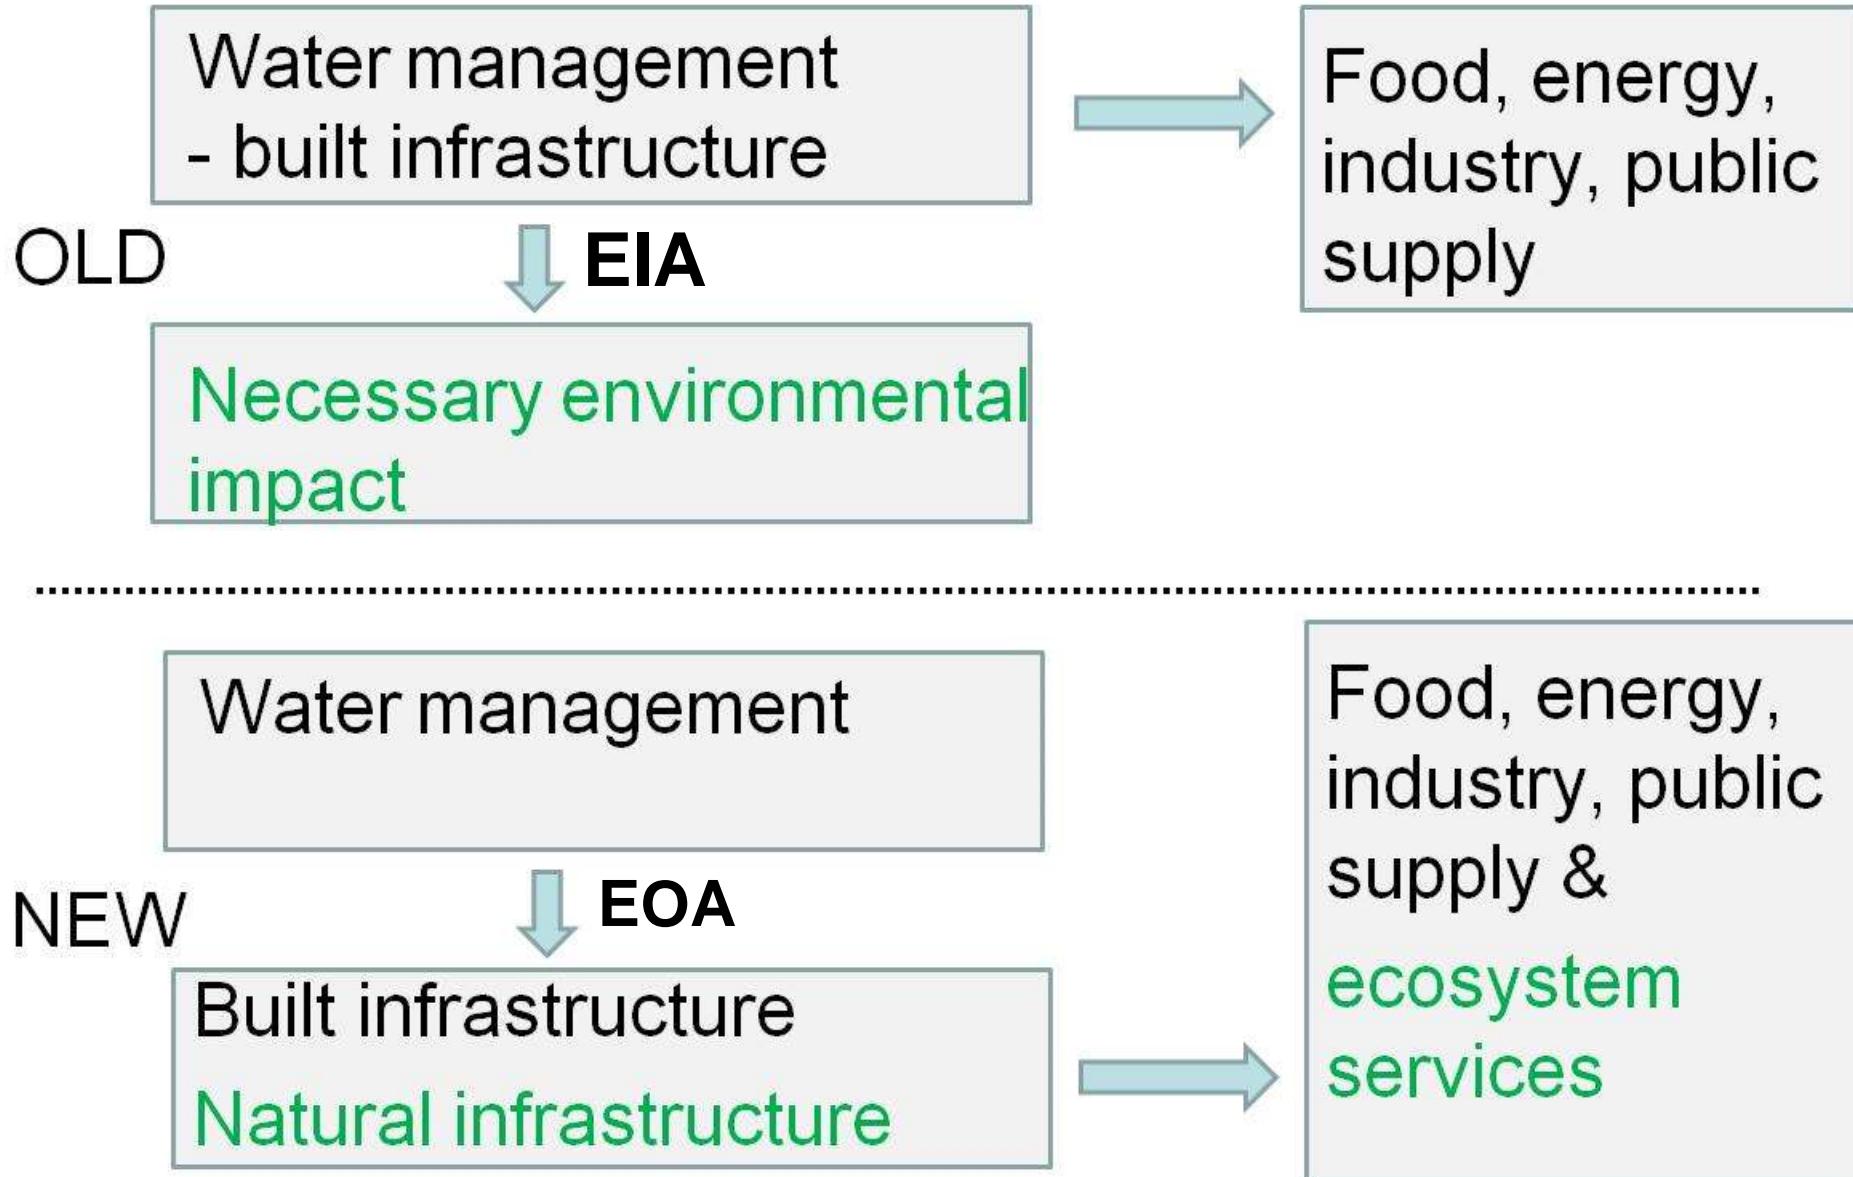

# Integrated management

embankments

barrages

# Paradigm change

# River Ganga - Environmental flow Scorecard

Scoring progress and prioritising future activities in Ganga environmental flows

1) Delegates placed green dots to show how much progress has been made in the environmental flows

2) Delegates placed gold dots to show where priorities should be in developing environmental flows in the future

Future priorities	themes	progress				
		Not yet considered	Initial thinking completed	Practical aspects considered	Some aspects in place	Fully operational
